

AI BASED MARKET TREND AND COMPETITOR ANALYSIS PROJECT REPORT

SYNOPSIS

The rapid growth of e-commerce platforms has resulted in the generation of large volumes of market data including product prices, customer reviews, ratings, and competitor information. Analyzing this data manually is difficult and time-consuming, especially when users need to compare products across multiple platforms. Businesses also require effective tools to understand competitor strategies and market trends in order to make better pricing and marketing decisions.

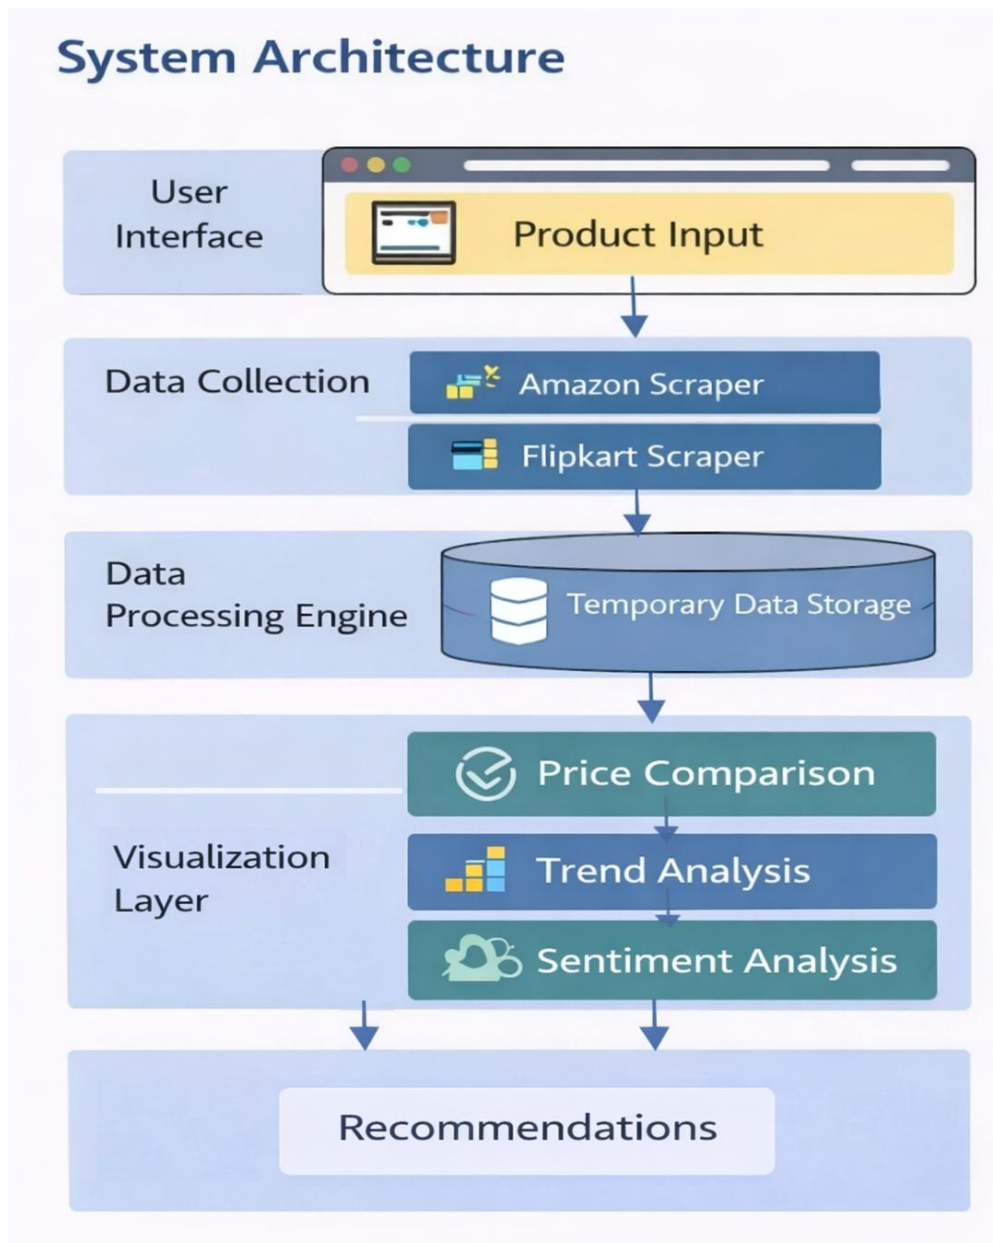

The AI Based Market Trend and Competitor Analysis System is developed to address this challenge by providing an automated platform for collecting and analyzing market data. The system integrates with external APIs and online data sources to gather product-related information such as prices, ratings, and customer reviews. The collected data is processed through an Artificial Intelligence (AI) pipeline which performs various analytical tasks.

The system performs price comparison across different platforms to identify the best available price for a product. It also analyses price trends to understand how product prices change over time. In addition, the system performs sentiment analysis on customer reviews to determine whether customer feedback is positive, negative, or neutral.

The results of the analysis are presented through graphical visualizations such as charts and graphs. These visual representations help users easily understand market behavior and competitor strategies. The system also generates recommendations that help buyers select the best platform for purchasing a product and assist sellers in understanding competitive pricing strategies.

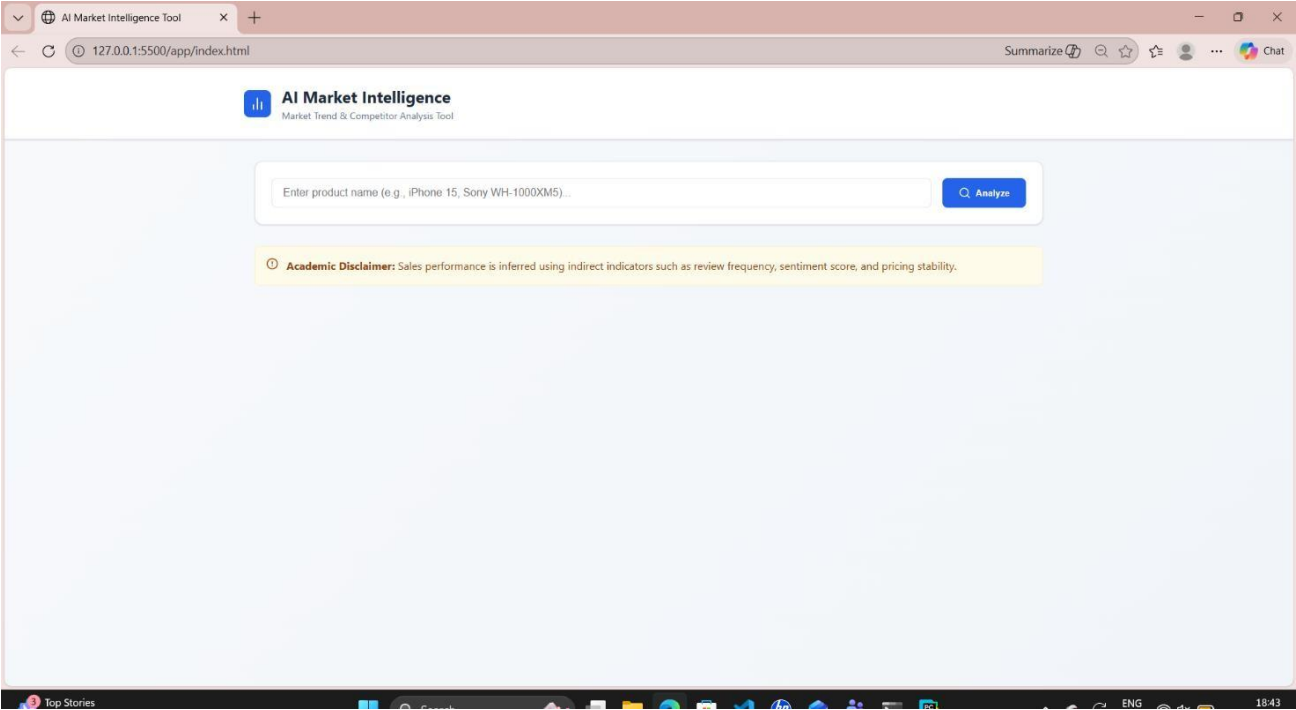

By automating the process of data collection and analysis, the proposed system reduces manual effort and improves the efficiency of market research. The project demonstrates how artificial intelligence techniques can be used to transform raw market data into meaningful insights that support better decision making.
