

AI POWERED MEDICAL FUND FORGERY DETECTION SYSTEM

The project entitled as **“AI Powered Medical Fund Forgery Detection System”**, which is created for society people who needs funds for Medical treatment This has been developed using Python as the front ends and Mysql server as the back end.

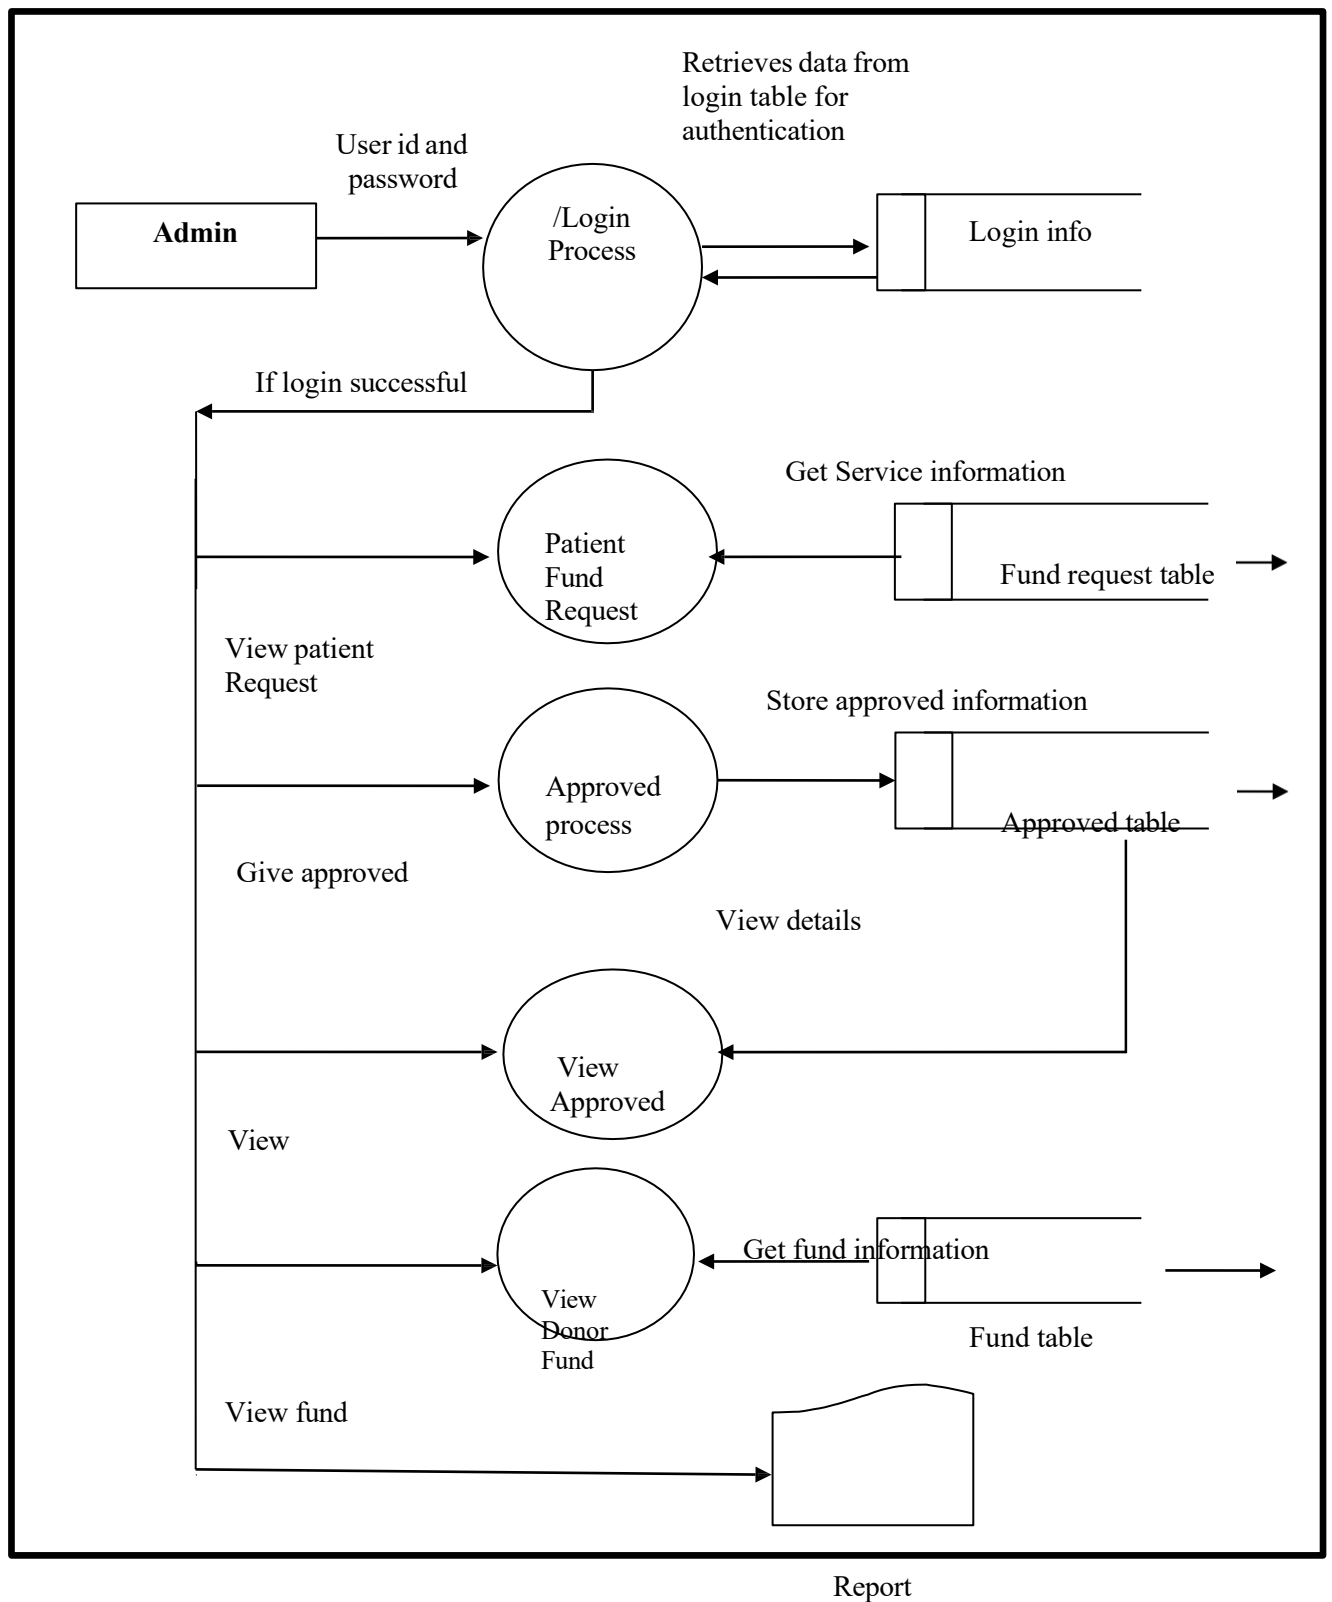

This project is aimed at developing for hospital and fund donators. In this website mainly developed to identify the Medical help Treatment. Now a day's most of the people need funds for Medical treatment so that they are posting fund related ads in what's app or other social media. Scammers are everywhere Scammers are purposely creates fake Medical Treatment bill copy and they are request fund. This type of medical fund request totally cheats the user. It is a difficult process identifies the fake Medical help Treatment. Main aim of the proposed application detects and block fake medical help Treatment fund request using Artificial Intelligence (AI). This project consists of two roles one is patient and another one is donor. Initially patient and donor need to register with the application by submitting their details through online. After that patient can login this application using their username and password. After successful of patient login they can add the medical help service request details along with treatment related bill proof image information. After successful of upload information Artificial Intelligence check from hospital dataset whether patient uploaded treatment related information is correct or not using pattern matching approach. After successful of verification once fund request is original it will show to donor or else fund request will block . Donor can login into this website and can view approve for medical help request. User can able to make payment for medical service after successful payment they can upload complete payment information through this site.
